Software Engineer · Full-Stack Developer · AI-Native Engineer

SUMMARY

Engineer who learns by shipping. I pick up new technologies by using them to migrate or build real projects — not by reading tutorials — and I treat AI agents as *independent verifiers, not auto-completers*. Master of Information Technology graduate (Flinders University, 2025). Full Australian work rights, no sponsorship required.

HOW I WORK

- **Learn-by-shipping.** Every new tool earned a place in my toolkit by surviving a real feature. I picked up Hono, Drizzle, PostgreSQL, NextAuth v5, shadcn/ui, and Motion v12 by migrating working code into them — forcing real tradeoffs that blog posts can't teach.
- **AI as independent verifier, not auto-complete.** Claude writes code and test specs; Codex (GPT-5.4) independently writes and runs the tests. The two-agent split eliminated the self-review "fake-green" pattern that plagued my earlier work.
- **AI tooling as infrastructure.** I maintain `tim-dev-rig` — a version-controlled Claude Code harness (rules, hooks, custom slash-command skills like `/cvupdate`, `/fix`, `/doctor`, `/para`, cross-conversation memory). Every lesson from a failed PR gets distilled back into the rig.
- **Observation-first debugging.** Hard rule against source-level guessing — collect runtime evidence (curl, Vercel logs, Sentry) before changing code.

FEATURED PROJECTS

Food Delivery Platform — github.com/TiM1113/FoodDelivery-AWS-Vercell

Started on Express + MongoDB; rebuilt through 6 deliberate phases as my primary learning vehicle. Each phase was a focused loop on one discipline — architecture migration to a Hono + PostgreSQL/Drizzle monorepo with Zod contracts shared via `packages/shared`; security through real bugs (IDOR, price tampering, cart races via `jsonb_set`); test rigor (170+ tests, written by Codex after I learned ~67% of earlier tests were "fake-green"); production observability with Sentry. Every modern serverless pattern I now use, I picked up here.

llm-wiki — Multi-Platform AI Knowledge Base — github.com/TiM1113/llm-wiki-skill

Open-source implementation of Karpathy's llm-wiki methodology. One bash installer ships the skill to four agent platforms (Claude / Codex / OpenClaw / Hermes) — designing for that breadth forced me to think contract-first instead of platform-coupled. Picked up graph algorithms (Louvain community detection, weighted edges) and synonym-aware search the same way: *by needing them, not by studying them*. Iterates via PR-based Codex review.

tim-dev-rig — Personal AI Dev Environment as Code — github.com/TiM1113/tim-dev-rig

Version-controlled Claude Code harness with global rules, pre-commit hooks, custom slash-command skills, and cross-conversation memory. Meta-engineering: I treat the workflows AI assistants run on as a first-class engineering artifact, not invisible plumbing.

Farm Time Management System — Lead Dev / Scrum Master — github.com/yuan0173/comp9034FarmSystem

Multi-role attendance & payroll PWA — React 18 + .NET 8 + offline-first IndexedDB sync. My first production-debugging experience: cold-start, JWT key drift, host configuration drift.

EXPERIENCE

Designer & IT Coordinator — Beijing & Shanghai (multiple studios), 2009–2023 — Cross-functional delivery with dev/design teams; asset pipelines and quality gates; web media/engineering hand-offs.

EDUCATION

Flinders University — Master of Information Technology, Feb 2024 – Nov 2025 (Graduated)

University of South Australia — Master of IT (Enterprise Management), Feb 2023 – Dec 2024

Nanjing University of the Arts — B.A. Animation, 2005–2009

PTE Academic: Overall 65 (L64 / R59 / S63 / W74)

WORK RIGHTS

Subclass 482 (secondary) — full Australian work rights, no employer restriction, no sponsorship required.
